Discovery Findings Report

This report presents the discovery findings and recommendations for the Falcon knowledge-search platform for Brightwater Logistics, covering the discovery period from 3 to 10 April 2026. It combines the current-state assessment, 14 stakeholder interviews and benchmarking of generic search approaches, and was prepared by the Delivery lead (User 2) for the Client sponsor and steering committee.

Key findings

- Knowledge is spread over five sources (shared drives, email, chat, CRM, laptops) and no single search covers them.
- Staff spend about 3 hours a week finding documents; the cost is highest in operations and customer service.
- Most people trust a document they can open and read more than a ranking score; they want to see why a result matched.
- Staff share only finished work today. They said they would share drafts if they could choose per file and withdraw it later.
- File names are the main way people recognise a document, so name-based matching must stay in the first release.

Recommendations

Ref	Recommendation	Priority
R1	Search the user's own files first, then teammates' shared files	High
R2	Let each user mark files public or private per folder and per file	High
R3	Generate short tags from file content to improve matching	Medium
R4	Add question answering over shared documents after search is trusted	Medium
R5	Integrate the CRM for account notes after the core search works	Low

Risks

- Adoption: staff may not publish files unless sharing is easy and reversible.
- Content quality: duplicate and outdated files will surface unless age is visible in results.
- Client data: private files must never leave the user's laptop without an explicit choice.

Next steps

The steering committee will confirm scope for Phase 1 in the Statement of Work. Delivery will start sprint planning for the Harborview Platform with Sprint 1 beginning on 20 April 2026.
